Document Control Notice (Read First)

This document is a **PDF explanatory companion** to the control file `inspection_mode.md`.

What this document is

- A human-readable explanation of the Inspection Mode configuration
- A guide to what each section means, allows, and restricts
- A viewer-safe rendering for governance, audit, and standards review

What this document is not

- It is not executable
- It does not activate or modify Inspection Mode
- It does not override the `.md` file

The file `inspection_mode.md` remains the **sole authoritative access-mode control file**.

Important Operator Note — Mode Completion Context

The `inspection_mode.md` file is used **after** operational work has been completed in another mode (for example, ID_2).

Inspection Mode (ID_3) is intentionally **non-operational**.

The current configuration - including all ticked and unticked boxes - has been intentionally selected to support the **primary task of ID_3 (Inspection / Standards Reasoning)**.

In plain terms:
• The checked boxes are appropriate and sufficient for inspection and review tasks
• No operational or execution capabilities are implied
• Unticked options are disabled by design, not “optional defaults”

Changing Tick Boxes — Operator Guidance

Changes to tick boxes must reflect **explicit inspection intent**, not convenience.

When it is appropriate to tick additional boxes

You may enable additional boxes only if:
• the task requires expanded inspection or standards framing, and
• the operator explicitly intends to change the inspection posture, and
• the impact of that change is understood and reviewed

When it is appropriate to leave boxes unticked

Leave boxes unticked when:
• the capability is not required,
• the behavior would introduce ambiguity,
• or authority must remain constrained

Simple rule of thumb

If you are unsure whether to tick a box — do not tick it.
Unticked means intentionally disabled, not available later.

Any additional ticked boxes must be verified as matching the operator’s intent before use.

Next page includes

Inspection Mode — Rules & Operational Constraints for **Mode ID_3**

Viewer / Non-Executable PDF companion to the
`inspection_mode.md` execution file.

This PDF may be printed and used for **review, audit, and standards discussion** when configuring or interpreting `inspection_mode.md`.

Introduction

This document explains the rules, constraints, and enforcement logic defined in the access-mode control file `inspection_mode.md` for:

ID_3 — Inspection / Standards Reasoning

Inspection Mode is used to:
• inspect outputs produced by other modes,
• identify gaps, ambiguities, or misalignment,
• structure material for audit, review, or standards discussion.

Inspection Mode does **not** perform operational reasoning and does **not** authorize actions.

The `.md` file and this document are intentionally separated:
• The `.md` file defines what is enforced
• This document explains how to read and interpret it

No behavior described here exists unless it is already defined and enabled in `inspection_mode.md`.

Inspection Mode — Rendering and Control Notes

Rendering note:
• This file defines how reasoning rules are interpreted for this project.
• Checked items **[x]** are active and enforced.
• Unchecked items **[ ]** are inactive and must not be inferred.
• If no items are checked under a section, that capability is disabled.
• This file takes precedence over prompts or ad-hoc instructions.

Explanation

This section establishes the interpretation rules for the entire inspection configuration.

It ensures:
• no inferred permissions,
• no prompt-level overrides,
• no accidental expansion of authority.

The checklist format is deliberate: **explicit beats implied**.

Primary Access-Mode

[ ] ID_1 — Foundational / Learning
[ ] ID_2 — Operational / Runtime Reasoning
[x] ID_3 — Inspection / Standards

Only one primary mode may be selected.

Explanation

ID_3 is the **sole authoritative inspection posture** for this project.

Inspection Mode may:
• inspect outputs for standards alignment and structure,
• identify gaps, ambiguities, and inconsistencies,
• organize findings for review or audit audiences.

Inspection Mode may not:
• generate new operational reasoning,
• modify system behavior,
• assert compliance, certification, or approval.

This prevents inspection from becoming execution.

Secondary Access-Modes (optional)

[ ] Allow ID_1 as secondary (concept clarification only)
[ ] Allow ID_2 as secondary (context reference only)

If all options are unchecked, this is a **single-mode inspection project**.

Explanation

Secondary modes, if enabled, may:
• provide context only,
• never override inspection authority,
• never introduce operational decisions.

All reasoning remains strictly within ID_3 boundaries.

Reasoning Permissions

[x] Inspect outputs for standards alignment and structural consistency
[x] Identify gaps, ambiguities, and misalignment
[x] Structure material for audit, review, or standards discussion

[ ] Generate new operational reasoning
[ ] Modify system behavior or execution logic
[ ] Assert compliance, certification, or approval
[ ] Declare deployment readiness

Explanation

Inspection Mode surfaces findings and structure - it does **not** decide outcomes.

All conclusions remain advisory.

Cross-Mode Constraints

[x] Inspection mode authority must not be overridden
[x] Secondary modes may assist but must not decide
[x] Mode switching mid-session is prohibited

[ ] Permit equal or merged modes

Explanation

This locks the inspection posture for the session and prevents:
• authority drift,
• blended operational reasoning,
• retroactive reinterpretation.

Validation Requirements

[x] Evidence-based inspection required
[x] Findings must be traceable to source material
[x] Misalignment testing required

Inspection validation must include:
• deliberate removal or alteration of 2–3 elements,

• re-evaluation to observe error detection or propagation,
• follow-up questioning where ambiguity persists,
• recording of outcomes for review.

Explanation

Inspection Mode tests **robustness and traceability**, not correctness.

Enforcement and Escalation

[x] Inspection findings treated as signals only
[x] Human decision required for any action

[ ] Automated enforcement permitted

Explanation

Inspection findings inform governance - they do not trigger actions.

Human judgment remains the decision authority.

Session Control

[x] Inspection sessions must remain non-operational
[x] Stop or reset session on mode drift
[x] Create new project to change primary mode

[ ] Allow posture change within session

Explanation

Inspection posture is session-stable.

Any transition to operational or learning modes requires a **new project**.

Acknowledgement

[x] I confirm this configuration reflects an inspection-only reasoning posture.

Explanation

This confirms:
• deliberate inspection scope,
• understood constraints,
• acceptance of human responsibility.

Final Note (Non-Normative)

This document exists to support **clarity, governance, and safe standards review**.

The `.md` file remains the **single source of truth**.
